CDK4I;
                                                                          exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to inhibiting adenyl succinate synthetase (ASS) activity in methylthicadenosine phosphorylase (MTAse) deficient cells of mammalian host. The invention may be used as a treatment for cancer, especially breest and colon cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Inhibiting adenine succinate synthetase (ASS) activity in methylthicadenosine phosphorylase deficient cells of mammalian involves administering ASS inhibitor which depletes adenosine smonophosphate in cells.
                                                                                                                                        Homo

The polynucleotides are useful for preparing a composition for diagnosing or treating cancer. Sequences of the invention are also useful in gene therapy. The present sequence is human methylthicadenosine phosphorylase (MTAse) genomic DNA used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New

Antigenic peptides may be generated from this sequence encoding methyladenosine-phosphorylase, which are then used to generate antibodies specific for MTAse. The produced antibodies may be used in an immunoassay for the detection of MTase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Selective methionine starvation of methyl:thio:adenosine phosphorylase negative tumour cells - used in chemotherapy of mammalian malignant cells.

This is the DNA sequence of a human methylthioadenosine phosphorylase (MTAse) genomic DNA clone that was isolated from a cosmid gene library using an MTAse cDNA probe. The encoded enzyme catabolises methylthioadenosine to adenine for endogenous salvage incorporation into the intracellular AMP pool. The invention relates to methods for treating and preventing the onset and maintenance of multiple drug resistance (MDR) in animals undergoing cancer chemotherapy. In the methods provided, cells are depleted of AMP and ATP and are thus unable to supprt P-CC glycoprotein activity. One method obtains a population of target cells from a host and assays for loss of MTAse activity. MTAse deficient cells of adenine and suppresses P-glycoprotein activity. The Starves the cells of adenine and suppresses P-glycoprotein activity. The small-cell lung cancer cells, acute lymphoblastic leukemia cells comprising small-cell lung cancer cells, acute lymphoblastic leukemia cells, glioma cells are also treated for MDR with purine synthesis inhibitors. MTAse competent cells are also treated for MDR with purine synthesis inhibitors. MTAse competent cells are also treated for malignancy with other competent cancer drugs. MTase sequence-specific oligonucleotides can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        exon
                                                                                                                                                                                                                                                               Suppression of multiple drug leukemia's.

                                                                                                                                                                                          The invention describes a method of detecting methylthicadenosine phosphorylase (MTAse) comprising adding oligonucleotide probes hybridisable to MTAse encoding nucleic acid to an assayable sample of cells, where the presence of the nucleic acid indicates the presence of the MTAse in a cell. The inventive method is simple and efficient in detecting the presence of MTAse in the mammalian cell. The availability of the recombinant MTAse enables the production of highly pure material with greater ease and in greater quantities than was obtained using Rangione method for the isolation and purification of native MTAse. This sequence encodes rat methylthicadenosine phosphorylase (MTAse)
                                                                                                                                                                                                                                                                                                                                                                WPI;
                                                                                                                                                                                                                                                                                                                                                                                                      (NOBO/)

The polynucleotides are useful for preparing a composition for diagnosing or treating cancer. Sequences of the invention are also useful in gene therapy. The present sequence is CDK4I related DNA

                                                                                                                                                                                                                                                                                                                                                           ABQ56306 to ABQ60787 represent isolated nucleic acids (I) differentially expressed in cancer tissues. ABB78993 to ABB79004 represent proteins cencoded by the ABQ60776 to ABQ60787 nucleic acid sequences. (I) can be used in antisense therapy. An antibody immunoreactive with a polypeptide encoded by (I) is useful for detecting cancer in a patient sample, and concleic acid which hybridises to (I) in a cell. A probe/primer derived from (I) can be used for determining the presence of a nucleic acid which hybridises to (I) in a cell. A probe/primer derived from (I) can be used for determining the phenotype of cells in a sample of cells from a patient. (I) is useful for determining the presence of colon cancer in a cell or tissue type, for determining the presence or state of other type of cancer, in antisense therapy, to generate macroarrays on a solid surface, to identify a chromosome on which the corresponding gene resides, and in tissue profiling, forensics, genetic analysis, mapping and diagnostic applications. (I) can be used to raise antibodies, and to screen for peptide analogues and antagonists
                                                                                                                                                                                                                                                                                          Query Ma

The present invention describes a composition (I) comprising: carriers and immunostimulants; and a polypeptide (II) of a ovarian tumour polypeptide encoded by a polynucleotide (III) having a cDNA sequence (S1) from the 10912 nucleotide sequences as given in ABL77023 to ABL87934, (III) encoding (II) having a sequence (S2), a T cell population of (II), cor antigen presenting cells that express (II). (I) has cytostatic activity. An oligonucleotide (IV) that hybridises to (S1) can be used for detecting ovarian cancer in a patient's biological sample preferably serum or ovarian tissue. The method comprises contacting a biological sample from a patient with (IV), detecting the amount of polynucleotide (IV) and comparing the amount to a predetermined cutoff value and thereby detecting ovarian cancer in the patient, where the amount of polynucleotide hybridising to (IV) is detected preferably by clymerase chain reaction (PCR). (I) comprising (III) and/or (II) is useful for stimulating and/or expanding T cells specific for an ovarian cutoff cutofin design and preparation of ribozyme molecules for inhibiting contesting and preparation of ribozyme molecules for inhibiting contesting well known techniques
                                                                                                                                                                                                                         Query Ma

                                                                                                                                                                                                                                                                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic a genes from Drosophila interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI; 2001-656860/75

/note="Vector: pCNS; Site_1: EcoRI; Site_2: NotI; The poly
(A) + RNA was dephosphorylated with bacterial alkaline
phosphatase (BAP) and then decapped with tabacco acid
pyrophosphatase (TAP). The decapped intact mRNA was
ligated with DNA-RNA linker including EcoR I site by
treatment of T4 RNA ligase and the first strand cDNA was
synthesized from oligo dT-selected mRNA by priming with
dT-tailed vector. The dT-tailed vector was adjusted to
have about 60nt. The cDNA vector was circularized with E.
coli DNA ligase after digestion of EcoRI which site is
also included in vector. An RNA strand converted to a DNA
strand by Okayama-Berg method. The obtained cDNA vectors
were used for transformation of competent cells E. coli
ToploF' by electroporation method. The cDNA libraries
constructed by this method are full-length enriched cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /organism="Homo sapiens"

Email: seqref@genoscope.cns.fr, Web: www.genoscope.cns.fr
1st strand cDNA was primed with a NotI-oligo(dT) primer. Five prime
end enriched, double-strand cDNA was digested with Not I and cloned
into the Not I and EcoRV sites of the pCMVSPORT 6 vector. Library
was not normalized. Library was constructed by Life Technologies, a
division of Invitrogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Li, W.B., Gruber, C., Jessee, J. and Polayes, D. 1st strand cDNA was primed with a NotI-oligo(dT) primer. Five prime end enriched, double-strand cDNA was digested with Not I and clone into the Not I and EcoR V sites of the pCMVSPORT 6 vector. Library was normalized. Library was constructed by Life Technologies, a division of Invitrogen. This sequence belongs to sequence cluster For more information about the constructed by the sequence cluster for more information about the constructed belongs to sequence cluster for more information about the constructed belongs to sequence cluster for more information about the constructed belongs to sequence cluster for more information about the constructed belongs to sequence cluster for more information about the constructed belongs to sequence cluster for more information about the constructed by the constructed belongs to sequence cluster for more information about the constructed by the constructed
